

XMatch New Features

Since the introduction of XMatch™ in early this year, sales has continue to gather pace. The application has been sold to countries around the world including USA, Hong Kong, Taiwan, Korea, Singapore, Malaysia, Thailand, Philippines, Egypt and Turkey. As part of our continuous effort to help our customers optimize productivity and efficiency, eWarna has added new features to XMatch™ :

Trim Search

This new function allows a user to perform precise color search of live color libraries provided online by a wide and growing range of global trim suppliers, from thread through zips via eWarna's open platform color engine.

"This is a remarkable breakthrough in color technology. Since implementing this new system we have already seen great improvement in the communication with our factories."

Alam Zelcer, President and COO
Isaco International

Spectro Correlation

Most buyers require physical swatches for final approval on lab dips. This "correlate" web based function allows a buyer to communicate the decision on physical swatches by prompting the buyer to re-measure the swatch on a spectrophotometer. A link will be created automatically between that measurement and the one from the mill. Overtime, live summary reports of the results can be viewed on demand.

"It assures us that accurate information on our color palette is being transferred overseas, which saves us a tremendous amount of time."

Lucio DeCalvalho, Design Director
Isaco International
